

APEX SAAS PORTAL SECURE

Live End-to-End Execution & Verification Operations Guide

This document serves as an operational walkthrough guide for utilizing the multi-tenant cryptographic software architecture. It maps out the precise sequence to onboard tenants, manage clinical workflows, and record transactions seamlessly on the live interface environment.

Core Architecture Concept: Data Partitioning

The Footwear Factory Metaphor: *Imagine a high-scale footwear manufacturing factory where inventory lines for distinct global brands (e.g., Nike and Adidas) are processed simultaneously. Mixing raw materials into a generic storage box inevitably compromises data and physical operations. Therefore, every single shipment box is attached with a strict identifying brand stamp tag.*

In a true multi-tenant database infrastructure architecture, a generic table configuration is prohibited. Every isolated transaction record, including patients, schedules, clinical charts, and billing items, is programmatically appended with a secure, permanent field boundary identifier: **tenantClinicId**. This guarantees absolute workspace containment; for instance, Dr. Emily can exclusively access data records matching her signed tenant certificate boundaries, while surrounding databases remain mathematically isolated.

Phase 1: SaaS Super Admin Operations View

Before standard data processing transactions can occur, a high-level corporate branch (Clinic Tenant Node) must be declared and registered onto the central database platform matrix.

Step 1: Authenticate Security Axis

1. Navigate to the cloud core system window link: `http://localhost:5173/`
2. On the multi-tenant authorization panel, input the global root credentials:
 - **User Identity Email Axis:** `superadmin@saas.com`
 - **Secure Access Account Password:** `zaid123`
3. Execute submission by clicking on the  **Verify Identity & Launch Tenant Axis** action block.

Step 2: Onboard New Clinic Infrastructure Node

1. Upon successful authentication validation, the interface exposes the interactive  **Global SaaS Fleet Management System Infrastructure** workspace panel.
2. Locate the input deployment form and populate it with structural parameters:
 - **Clinic Corporate Name:** Input a specific branch signature, e.g.,

Zaid Dental Care & Orthodontics

- **Medical Specialty Axis:** Select the domain mapping identifier, e.g.,  Dental Workspace
- **Commercial Subscription Tier:** Assign a service package profile, e.g.,  Growth Tier Plan or  Enterprise Suite VIP

3. Click on the green action element:  **Inject New Clinic Profile.**
4. A secure synchronous browser alert message verifies validation completion: *"Success: Zaid Dental Care is now LIVE on the SaaS network!"*

Phase 2: Isolated Clinic Admin & Doctor Operations View

Once a dedicated tenant node profile is active in the cluster system, internal clinical processing records can be initialized safely under that branch.

Step 1: Session Interception Swap

1. Terminate the administrative master session loop by clicking on the  **Terminal Session Logout** button on the bottom left corner.
2. At the secure portal redirect layout, authenticate using the system seed tenant credentials:
 - **User Identity Email Axis:**  emily@dental.com
 - **Secure Access Account Password:**  zaid123
3. Click  **Verify Identity & Launch Tenant Axis** to enter the custom medical workspace interface.

Step 2: Initialize Patient Profiles via CRM Module

1. On the left workspace menu layout, toggle the active navigation state to  **Patient Registry CRM.**
2. Locate the secure creation input fields and supply the patient dataset:
 - **Full Legal Name:**  Mohamed Zaid
 - **Contact Phone Axis:**  9876543210
 - **Age / Gender Vector:**  23 /  Male
 - **Isolated Medical History Logs:**  Root Canal treatment required, Bleeding gums.
3. Execute deployment by clicking on the  **Register New Patient Node** action element. The entry will seamlessly stream into the live encrypted tabular datagrid layout below.

Step 3: Map Clinic Appointments via Shift Slots Scheduler

1. Toggle the active workspace element on the left navigation console to  **Shift Slots Scheduler.**
2. The workspace mechanism programmatically intercepts the active context state memory and links the newly created patient key configuration automatically.

3. Provide the remaining scheduling matrix attributes:
- **Assigned Practitioner/Doctor Name:** Dr. Emily
 - **Target Sequence Date & Time:** 2026-06-10 at 11:00 AM
 - **Required Treatment Classification Type:** Tooth Extraction / Scaling Procedure
4. Hit the execution trigger button:  **Book Appointment Slot**. The underlying calendar query refreshes the analytics framework, incrementing the real-time queue overview count parameter safely.

Phase 3: Commercial GST Invoicing & Accounting Engine

- Following clinical treatments, financial accounting records must be compiled and saved using the built-in automated tax ledger arithmetic processing layout.
1. On the primary sidebar navigation menu, click on the  **GST Invoicing & Accounting** component option.
 2. Utilize the structural data mapping input grid to create discrete transactional items:
 - **Line Entry 1:** Procedure: Dental Scaling & Polishing | Base Cost: 1500 | Qty: 1
 - **Line Entry 2:** Procedure: Medicines / Antibiotics Bundle | Base Cost: 300 | Qty: 1
 3. Commit the configurations into memory by clicking the  **Add Item** button matrix.
 4. The system dynamically triggers the financial mathematical layer formulas:
 - Evaluates net base amount summation (**Subtotal = 1800**).
 - Enforces separate legal national statutory tax bounds: Central GST (**CGST @ 9% = 162**) and State GST (**SGST @ 9% = 162**).
 - Outputs final accurate transaction totals (**Grand Total = ₹2124.00**).
 5. Click  **Save & Print Bill Node** to securely lock the financial record inside the database collection space.

System Operational Verification Blueprint

Real-time State Sync Verification: To completely assure the validation of end-to-end multi-tenant transactional connectivity, select the  **Summary Analytics Dashboard** from the sidebar. The system state indicators must dynamically refresh to reflect the following system-wide balances:

- **Total Onboarded Patients Count:** 1
- **Active Shift Queues Load:** 1
- **Revenue Summary (INR) Tracker:** ₹2124.00 (Fully verified and integrated)
